Integrating a Zoho Creator application with another Zoho service using connections and APIs

Job Application Form — Zoho OAuth by Zoho CRM Integration Use Case

Experiment 7

241401115

Prepared by: Tejini V

Register Number: 241401115

Department: Computer Science and Business Systems

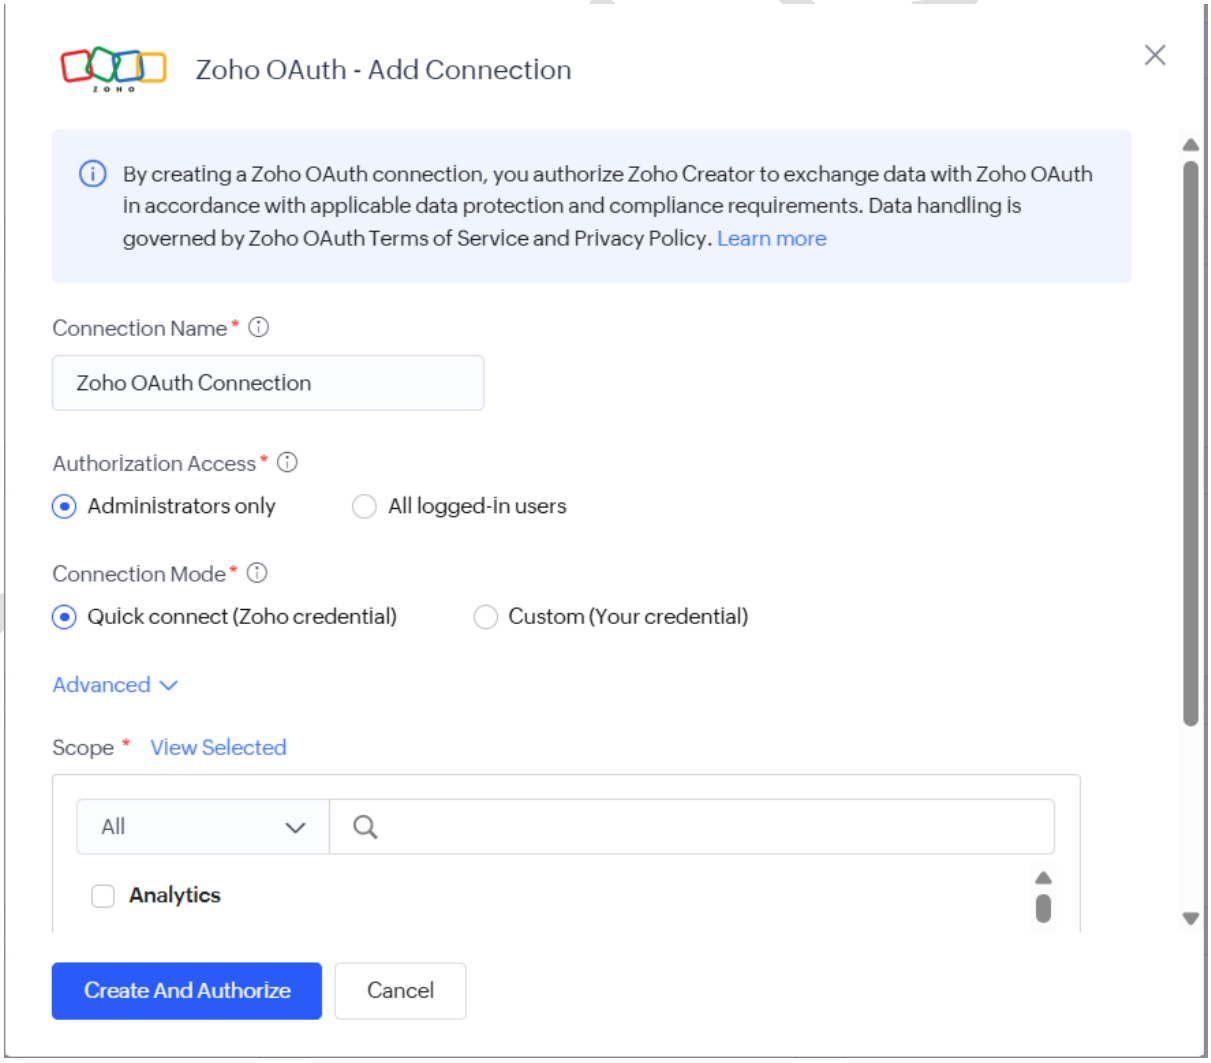

1. Aim

To integrate the "Job Application Form" application in Zoho Creator with Zoho CRM using a Zoho OAuth connection and Deluge scripting, so that every application submitted by a candidate automatically creates a corresponding Lead record in the Zoho CRM Leads module, without any manual data entry by the recruitment desk.

2. Procedure

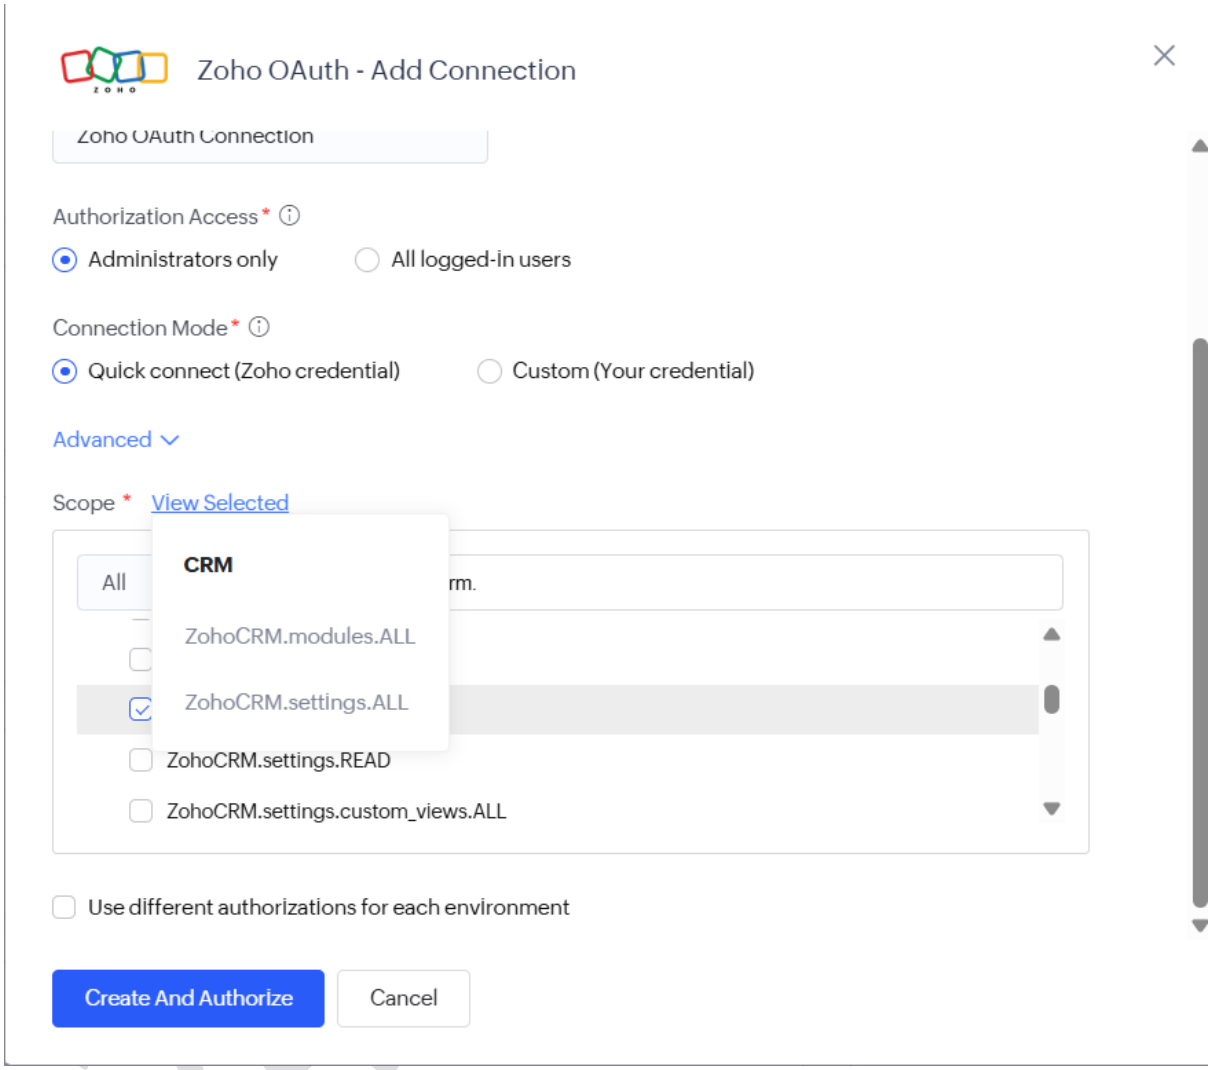

2.1 Creating the Connection

1. Open the Zoho Creator application and go to **Settings > Connections**. Click **Create Connection** and choose **Zoho OAuth**.
2. Set the Connection Name to "Zoho CRM OAuth" and confirm that the Connection Link Name is generated as zoho_crm_oauth. Leave Authorization Access as **Administrators only** and Connection Mode as **Quick connect (Zoho credential)**.

Explanation: This screen defines how Zoho Creator is allowed to talk to Zoho CRM. The link name zoho_crm_oauth is the identifier used later inside the Deluge script. Choosing Administrators only means only an administrator can authorize and use this connection.

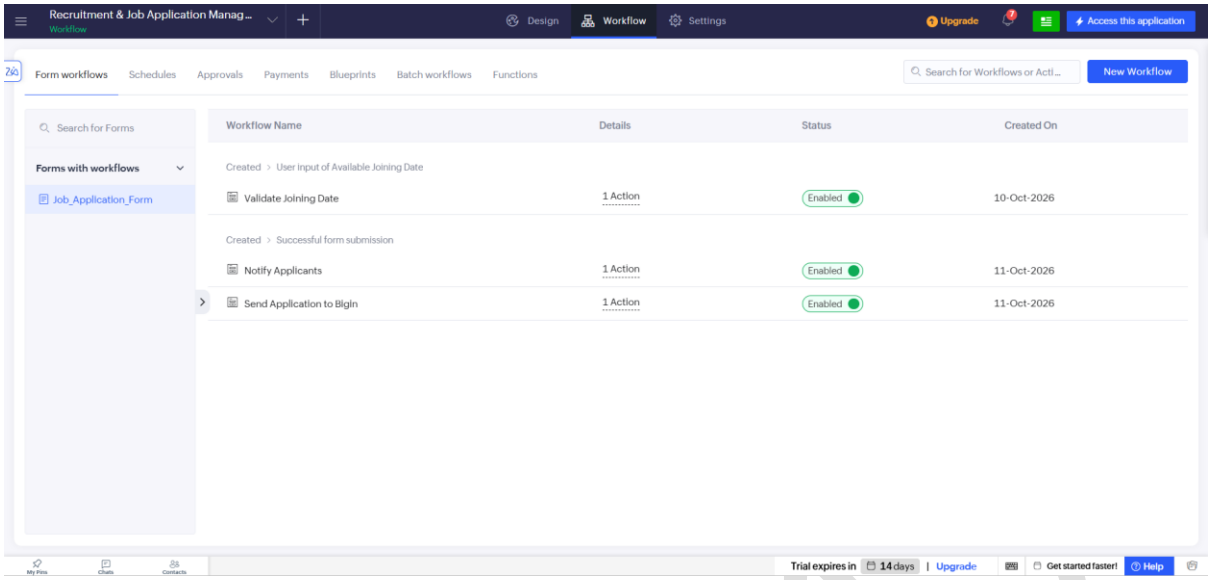

3. In the Scope list, search for ZohoCRM.modules and tick **ZohoCRM.modules.ALL**. Search for ZohoCRM.settings and tick **ZohoCRM.settings.ALL**. Click **View Selected** to confirm only the required CRM scopes are chosen.
4. Click **Create And Authorize**, sign in with the account that owns the Zoho CRM organisation, and click **Accept** on the consent screen. Confirm that the connection shows as connected.

Explanation: Scopes decide what the connection may do inside CRM. An earlier connection created with the older Zoho CRM service (zohocrm1) returned the error OAUTH_SCOPE_MISMATCH even with all permissions ticked. Creating a Zoho OAuth connection with explicit CRM scopes resolved this error. The separate Bigin connection created earlier was left unchanged.

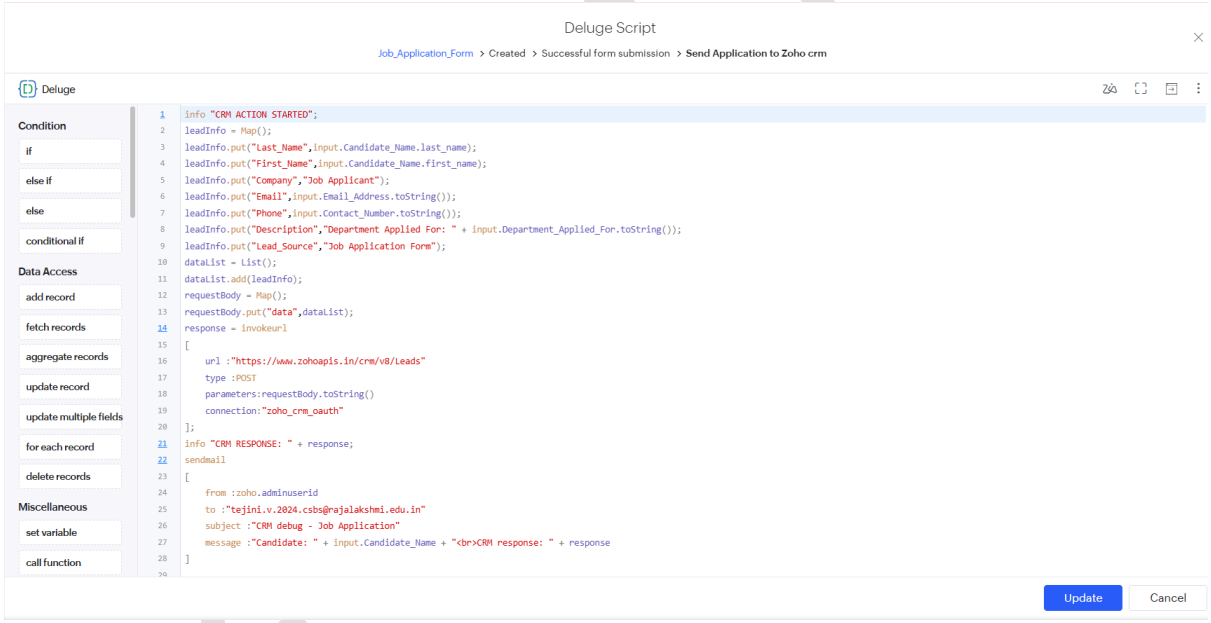

2.2 Creating the Workflow and Writing the Deluge Script

5. Open the **Workflow** tab, go to **Form workflows**, and create a new workflow on the form "Job Application" with the Record Event set to **Created** and the Form Event set to **On success**. Name the workflow so that it is identifiable on the Workflow dashboard, and make sure it is **Enabled**.

Explanation: The CRM action is attached to the successful submission of the form. Running only on success ensures that a Lead is created only for applications that have passed all validations.

6. Add a **Deluge script** action to this workflow and enter the following script:

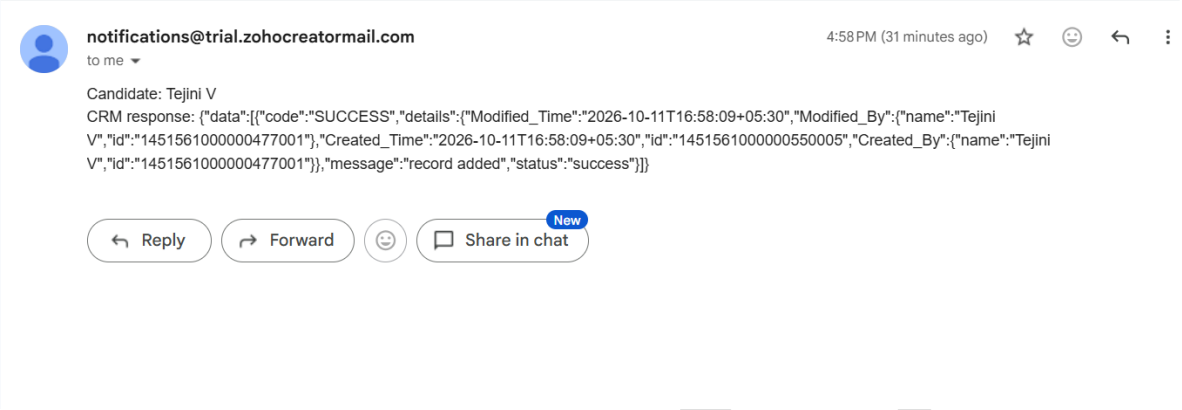

Explanation: The script maps the form fields to the CRM Leads fields: Candidate_Name to Last_Name, Email_Address to Email, Contact_Number to Phone, and Department_Applied_For to Description. The Company field is added because Leads in CRM commonly require it. The invokeurl call sends the data to the Zoho CRM Leads API on the India data center (zohoapis.in) using the zoho_crm_oauth connection. The sendmail block emails the full CRM response, which made it possible to confirm the real result instead of assuming the script had run.

7. Save the workflow and submit a **new** test application through the form. Editing an old record does not trigger a Record Created event.

3. Output

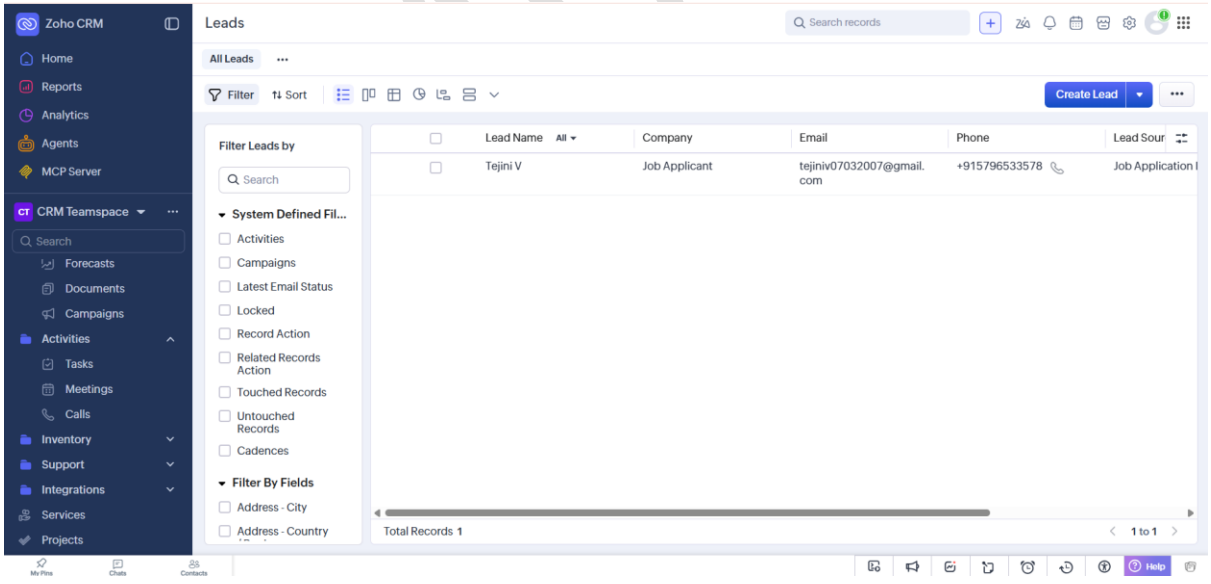

After the connection and script were saved, a new application submitted through the Job Application Form automatically produced a Lead in Zoho CRM.

CRM Response Received

Explanation: The email received after submission shows the response returned by Zoho CRM: the code SUCCESS and the message "record added", along with the new record ID 1451561000000550005 and the created and modified time of 11 Oct 2026, 16:58 (IST). This confirms that the workflow triggered, the script executed, the connection was authorized, and CRM accepted the data.

Lead in Zoho CRM

Explanation: The Leads module in Zoho CRM lists the candidate as a new Lead, with the name, email, phone number, and the department applied for in the Description field. The view was set to All Leads and sorted by Created Time to show the newest record first.

4. Result

A CRM integration was successfully built between the Job Application Form in Zoho Creator and Zoho CRM. Every successful form submission now triggers a Deluge script that sends the candidate's details through a Zoho OAuth connection and creates a Lead in the CRM Leads module. The integration was verified from the CRM response (SUCCESS, record added) and by locating the new Lead in the Leads module. This removes manual re-entry of candidate data and keeps the recruitment pipeline in CRM up to date as soon as an application is received.
