Exploring AI-Assisted Features and Built-in Analytics (Zia) in Zoho Creator

Job Application Form

Experiment 9

241401115

Prepared by: Tejini V

Register Number: 241401115

Department: Computer Science and Business Systems

1. Aim

To explore the built-in analytics, dashboard charts, report display options, and AI-assisted features available in Zoho Creator using the Job Application Management System developed for managing job applications and recruitment activities.

2. Objectives

- To examine the Recruitment Dashboard created in Zoho Creator.
- To observe how application data is represented using charts and summary information.
- To understand how the application report can be accessed and displayed in different formats.
- To explore the availability of Zia and other AI-assisted features in the application editor.
- To understand how built-in analytics can support recruitment monitoring and decision-making.

3. Software / Tools Required

- Zoho Creator
- Job Application Management System
- Zoho account with access to the application and its editor
- Web browser with an active internet connection

4. Introduction / Theory

4.1 AI-Assisted Features in Zoho Creator

AI-assisted features help users create applications, analyse information, and reduce manual effort. The availability of these features depends on the Zoho Creator edition, account plan, and interface.

4.2 Zia

Zia is the AI assistant available across the Zoho ecosystem. Depending on the product and account configuration, Zia may provide AI-assisted capabilities for working with business data. The availability of Zia features must be verified in the current Zoho Creator account.

4.3 Built-in Analytics and Dashboards

Zoho Creator provides dashboards, charts, and reports to present stored application data in a structured and visual format. These features help users monitor records and understand the distribution of information.

In the Job Application Management System, the Recruitment Dashboard was created to display application information through charts and summaries.

Common dashboard components include:

- **Charts:** Represent application data graphically.
- **Summary sections:** Display grouped information and record counts.

24140115

- **Reports:** Present individual application records in a structured format.
- **Interactive charts:** Allow users to inspect values represented by chart bars or segments, where supported.

4.4 Report Display Formats

Zoho Creator reports may provide different display formats depending on the report type and available options. These formats can help users view records as lists, calendars, timelines, spreadsheets, or Kanban boards.

5. Procedure

5.1 Opening the Recruitment Dashboard

1. Sign in to Zoho Creator.
2. Open the Job Application Management System.
3. Select the option to access the live application.
4. Open the Recruitment Dashboard from the application navigation menu.
5. Observe the charts, summary sections, and report access options displayed on the dashboard.

5.2 Examining Dashboard Charts

6. Examine the charts displayed on the Recruitment Dashboard.
7. Identify the categories or fields represented by each chart.
8. Where supported, move the pointer over a chart bar or segment to inspect the exact value.
9. Record the values displayed by the charts in the application.

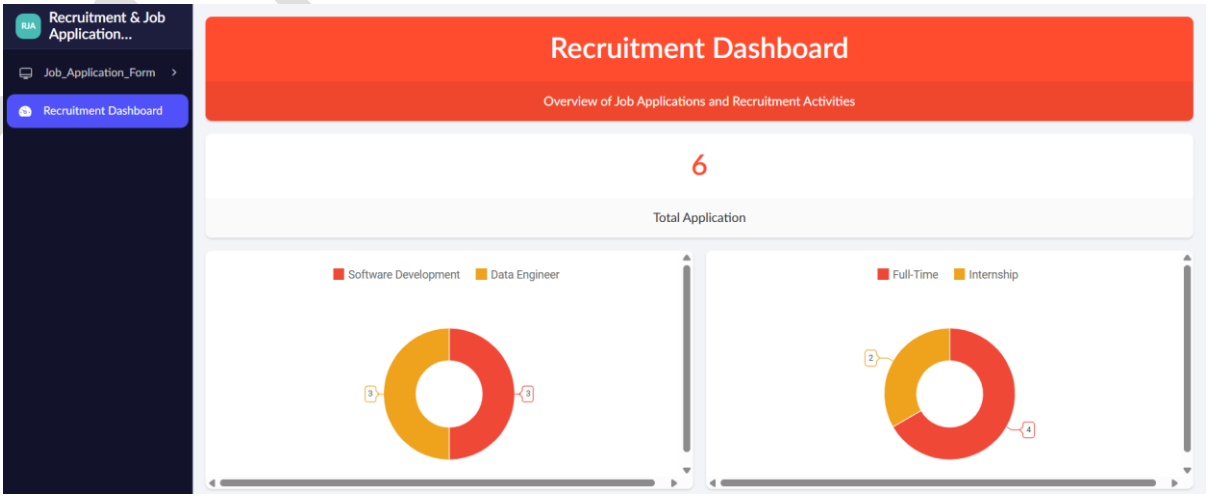

Figure 9.2: Chart showing job application data by categor and Chart showing the distribution of job application data.

Explanation: Charts summarise application information and make it easier to compare categories and understand the distribution of records. The actual values depend on the records stored in the application.

5.3 Examining Summary Sections

10. Observe any summary sections or grouped counts displayed on the Recruitment Dashboard.
11. Identify the field or category used for grouping.
12. Record the categories and counts currently displayed.

5.4 Opening the Application Report

13. Open the application report from the Recruitment Dashboard or the application navigation menu.
14. Observe the columns displayed in the report, such as candidate details, contact information, department applied for, and employment type.
15. Open the report's options menu and locate the **Show As** option, if available.
16. Record the display formats listed in the menu without changing the existing report configuration.

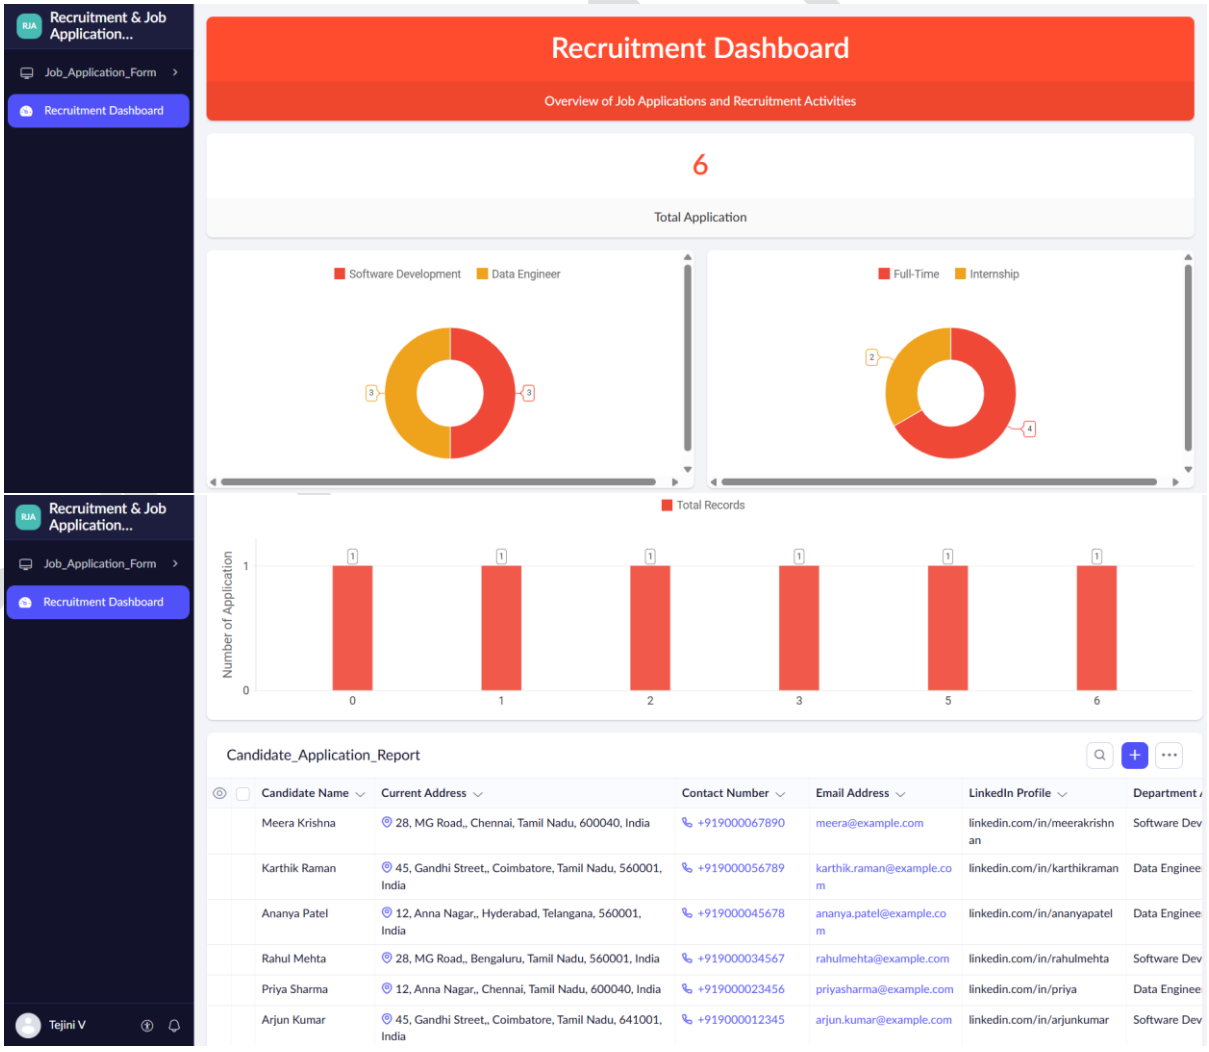

Figure 9.5: Job application report and its available display options.

Explanation: The report presents application records in a structured format. The available display options depend on the report configuration and the features supported by the current account.

5.5 Exploring Zia / AI-Assisted Features

17. Return to the application editor using the edit option.
18. Examine the Design area for any Zia or AI-assisted features.
19. Examine the Workflow area for AI-related options.
20. Record whether any AI-assisted feature is available in the current account and interface.

6. Dashboard Analytics

The Recruitment Dashboard displays the application information stored in the Job Application Management System.

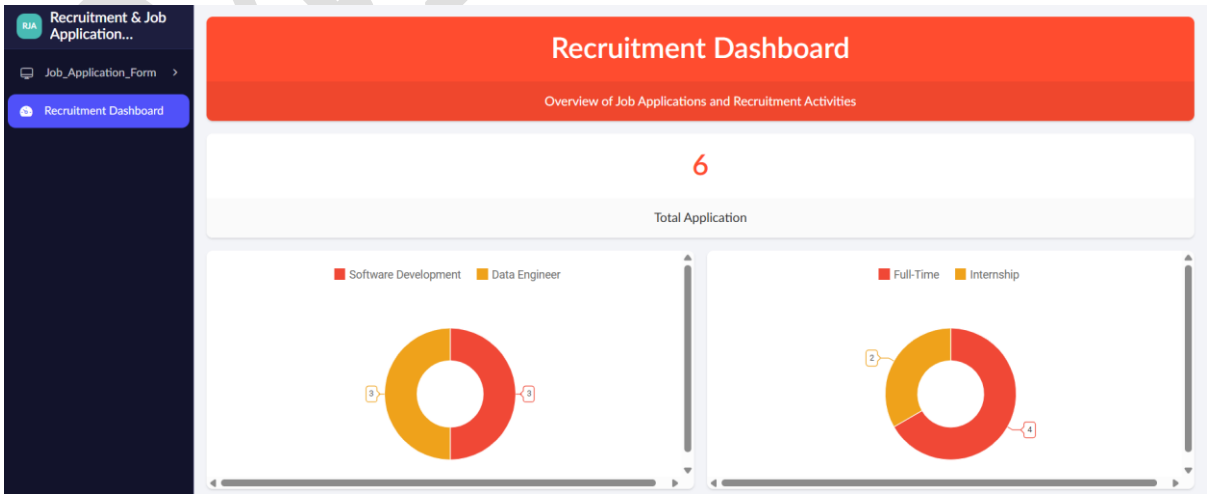

Component	Observed Information
Recruitment Dashboard	Overview of job application information
Charts	Visual representation of configured application data
Summary sections	Grouped application information and counts, where configured
Application report	Individual job application records
Report display options	Options available in the current report menu

Zia / AI-assisted features Availability to be verified in the current account

Explanation: The dashboard and report help users review recruitment information. The exact chart values and categories depend on the application records and dashboard configuration.

7. Interactive Chart Analysis

Interactive charts allow users to inspect the values represented by chart bars or segments, where the chart supports this feature.

Explanation: Reading chart values helps users interpret application data accurately rather than estimating values from the visual representation.

8. Built-in Report Views

The **Show As** menu can be examined to identify the report formats available in the current application.

Option	General Description	Possible Use
List	Displays records in rows and columns	Reviewing candidate details
Calendar	Displays records by date	Reviewing applications by date, if supported
Timeline	Displays records chronologically	Understanding the sequence of records, if supported
Spreadsheet	Presents records in a grid layout	Comparing candidate information
Kanban	Displays records as cards in columns	Grouping applications by a suitable field, if supported
Import	May provide an option to import records	Adding records from an external file, if supported

Note: Include only the options actually displayed in your report's **Show As** menu. Import may be a separate action rather than a display format.

9. Zia / AI-Assisted Feature Exploration

The Design and Workflow areas of the application editor were examined to check whether Zia or other AI-assisted features were available.

If no such feature was available, state:

"Zia / AI-assisted functionality was not visible in the areas examined in the current account and interface. Therefore, the experiment focused on the built-in dashboard analytics, charts, and report display options available in the Job Application Management System."

10. Result

The built-in analytics and reporting features of the Job Application Management System were examined in Zoho Creator. The Recruitment Dashboard, configured charts, summary sections, and application report were explored. The available report display options were identified, and the application editor was examined for Zia or other AI-assisted features.

11. Conclusion

The experiment demonstrated how Zoho Creator's built-in dashboards, charts, summary sections, and reports can support the monitoring of job application information. The dashboard provides a visual overview of recruitment data, while reports allow users to inspect individual application records. The availability of Zia / AI-assisted features depends on the current account and interface and was documented based on the features accessible during the experiment.
